

2 + Add by Seeing one surface redesigned — the a-a-card flow from 1d- everything else stays committed

The row catalog is retired — you can't judge a card by a sentence. Adding now happens by seeing the card at real size, and — where Vela leads the platforms — by seeing it already sitting on your sky before it lands. Opens from Add a card in Tend, lands on the current sky, still card-agnostic: every tile is the standard placeholder; it's the frame the real faces will fill later.

Tend - Add a card → browse cards at real size → it previews on your sky → Flip to size - S M W L → Add — it lands as shown

The composition, not the card

As a card is focused it drops into a live preview of the current sky, ringed, nudged, neighbors reflowed. You judge the room, not the furniture — 2a.

Add and connect are one surface

Unconnected cards sit in the same gallery as dim ghosts at real size, dotted there, a sign-in, a key, just a location. Connect places the tile lights where you left it.

Size is chosen by seeing

S - M - W - L flips the real tile and the sky preview together; the card lands exactly as shown. No resize-after-the-fact surprise (resize later still lives in Tend).

Added is visible

Cards already on this sky wear a quiet mark and the action becomes "Add again" — duplicates stay possible, but never silent.

2a Take A — the shelf under the sky

your sky stays on screen the whole time, centering a life is focusing it — browse and preview are one act

BROWSING — MID-SWIPE ON THE SHELF

One shelf runs through every service — captures change as it passes (Linear, then Weather), so groups are felt, not tabbed. Each tile is the card at its real size and proportion. Linear - Card 1 already lives on this sky - it says so on its own face. The magnifier filters the shelf: between gestures the sky above shows exactly what you have.

Placement: the previewed card lands at the first spot its size fits (the same rule the reflow shows); moving it after is one hold-drag away, and the preview makes that need arise. The sky above is the real sky, scaled back a step — the same zoom-out language as page altitude, so "smaller means the whole of it" is already learned.

FOCUSED — IT PREVIEWS ON YOUR SKY

The centered tile appears on the sky above, ringed at real proportion — the right column grows to take it, neighbors reflow. Flip S - M - W - L and both the tile and the preview change together. Add lands it exactly there; the shelf stays for the next card.

A GHOST — SEE IT, THEN PAY ITS PRICE

The preview never flies: an unconnected card sits on the sky as the dim ghost it would be. Its price is on its face, and the one button pays it — out and back like every connection, landing here with the tile lighting. Then Add appears. Sizes wait until it's lit.

2b Take B — the full gallery

breadth first: every card on the sky's own grid, at real size; the preview is a step, on focus

BROWSING — THE WHOLE CATALOG, REAL SIZES

The gallery is laid on the sky's own two-column grid, so a wide card is wide and a small one is small — proportion is information. Ghost sections state one price for the whole screen. Scroll for everything search cuts across. The sky itself is off-screen — that's the cost.

FOCUSED — THE PREVIEW STEP

The gallery parts and your sky fills the frame, near real size, with the card ringed in place — the biggest, most honest preview of the two takes. Sizes flip the composition live; Back returns to the gallery exactly where you left it.

THE CALL BETWEEN THEM

A keeps the promise continuously — the composition is on screen for every tile you pass, and browse, preview and size are one gesture. At Vela's real catalog (five services, a dozen cards) its narrow shelf costs nothing.

B is the shape that survives a big catalog: full-grid breadth, prominent search, and a bigger preview — but the preview is a mode, and mode switches are where calm dies. My learn: A now, borrowing B's search field verbatim when the shelf filter opens.

3 Many Skies

the canvas above one dashboard - pages, tending, Pro, the wall - card-agnostic

A person can keep several skies and swipe between them. Direction B, committed: **two altitudes inside one Tend**. The dial still flips between looking and tending, exactly as shipped — and in Tend, the page dots grow into a pressable capsule; press them and the view flies to **page altitude**, where whole dashboards are the tiles. Every card here is a generic placeholder — the frame is the design; the faces come later.

Glance - a sky → swipe - the next sky → dial - Tend this sky's cards → press the dots - the skies → tap a sky - descend → dial - Glance

The dots are the door

In Tend the page dots grow a capsule and become pressable — the control that shows the set is the control that opens it. Press: the skies. Tap a sky, back down — 7a.

Nameless until named

Skies are dots, not names. An optional label lives only at page altitude (and in the wall's hold capsule). Glance never grows tile — 7e.

Swipe never edits

Swiping means the next sky — in Glance and in Tend alike. Edit entry is only the deliberate dial flip (or holding a card). Nothing structural rides on a gesture a swipe can bring — 7a.

The wall hangs one sky

Hanging chooses one dashboard. Cycle is opt-in, slow, off by default, set from the phone. The wall stays glance-only; its hold shows where you are, never an edit surface. — 7h, 8i.

Scope: every tile is the standard card with a neutral value block — no card interiors (a later chat). The Pro payroll screen is a later chat too; only its trigger lives here. Pro has exactly two doors, both "more places to look": a second sky (7f) and the wall. Single-sky Tend is unchanged from The Sky Fills In; the guided front door is Raising the Sail. Web reader stands in for Rauc Native.

3a The paged canvas — Glance

swiping is a page turn; dots wake with a touch and sink like the dial

IDLE — NO CHROME, NO DOTS

One sky and nothing else. No dots on an idle surface — a second dashboard adds zero pixels to the thing you stare at all day.

MID-SWIPE — THE NEXT SKY SLIDES IN

The touch that swipes also wakes the chrome — dial and dots appear together, for five seconds. A page turn can never edit; in Glance nothing under the finger can move.

SETTLED — DOTS LINGER, THEN SINK

Five seconds after the finger lifts, dots and dial sink together and the sky is bare again. Each sky keeps its own arrangement and its own worst news — a stale dot travels with its card.

Why dots and not names on the glance surface: a label is a thing to read; a dot is a thing to know. Two to three skies is the honest case — at that count, position is identity. Names exist, optionally, one altitude up (7e).

3b The seam — one dial, two altitudes

Tend opens on this sky's cards, exactly as shipped; the dots are the door up

CARD ALTITUDE — TEND, SKY 2 OF 2

Everything from the shipped single-sky Tend, unchanged — plus one new fact: the dots have grown a capsule. Information became a button. Swiping here still turns the page.

PAGE ALTITUDE — THE SKIES

Whole dashboards become the tiles — the dots, grown. The current sky arrives ringed (the same selection language as a card). Actions belong to the ringed sky; the + silver waits at the end. Tap a sky to descend into its cards; the dial exits to Glance from either altitude.

Why the two levels never blur: they show different subjects at different scales. Altitude is full-size: cards with icons; page altitude is whole skies at thumbnail size, centered, with air around them. You cannot mistake one for the other, and the same two moves — tap to select, hold to drag — mean the same thing at both.

3c The placeholder card — states and sizes

the contract every future face must fit; flip "Worst Case" in Tweaks to stress it

SIX STATES, ONE TILE

Status is a badge on a dot, never a fill. Connecting shimmers in selection greys with the one allowed pulse; a ghost is transparent — all invitation, not a card pretending to be lit.

FOUR SIZES ON THE PHONE GRID

S 141 - M 142 - W 241 - L 242 on a two-column, 86px-row grid (24px gutters on the wall). The rule for every future face: the value never strays below its step; detail truncates first, then drops.

3d Tending cards — move, add, configure

card altitude; select is shown at fb; resize reflows neighbors live

MOVE — HOLD, LIFT, A SLOT OPENS

The held card lifts one surface step; a hairline slot opens where it will land. Carry it to the screen's edge and hold — the next sky slides in under it (the silver at right), so a card can move between skies without ever leaving your finger.

ADD — THE CATALOG, PRICED PLAINLY

Generic rows grouped by service; connected cards say Add and add as the small slide where the drag began; unconnected ones state their price — a sign-in, a key — exactly the language of the ghost. Add never leaves Tend. Superseded by turn 2 — the preview first galaxy.

CONFIGURE — A CARD'S OWN SHEET

Options opens the card's own sheet — rows are placeholders; name, each face brings its own in a later chat. The frame guarantees only the header, the row anatomy, and Remove at the bottom as the second path to deletion.

3e Tending skies — reorder, label, delete

page altitude; the same two moves — tap to select, hold to drag

REORDER — HOLD A SKY, CARRY IT

The held sky lifts and its slot waits as a hairline. Order here is the swipe order — and the dots reorder everywhere.

LABEL — OPTIONAL, TAP UNDER THE SKY

A label is a note to sell, not chrome; it shows here and in the wall's hold capsule (7) — never on Glance, never in the dots. Clear the text to return a sky to namelessness.

DELETE — THE SKY ITSELF ASKS

No modal — the tile's face becomes the question, and tapping anywhere dies is Keep. Connections survive (they belong to its account); only the arrangement dies. The last sky can't be deleted, only emptied.

3f The second sky — the Pro moment, two takes

a free person taps + an invitation, never a wall - the payroll screen is a later chat

TAKE A — THE DOOR ANSWERS

The + silver opens into this face in place — same motion as a real door, and tapping elsewhere closes it. Zero ceremony.

TAKE B — THE SAIL BRINGS IT

The mascot returns for exactly one breath — the sail bobs once on the sheet, gold as it was at the front door, then leaves. The sky is born lit, and the empty dot below already shows where the next card lands.

THE CALL BETWEEN THEM

A holds the product's temperature: the invitation is architecture, not theater, and it can't interrupt anything. B spends the mascot's scarce budget to make the one revenue moment feel like the front door did.

My learn: A on the canvas, B's copy. If the sail appears at every paid door it stops being a guest.

3g A new sky — the creation moment, two takes

a Pro person taps + the view descends into the new, empty dashboard

TAKE A — DEALT DARK

Honest and silent: a dark field, one plain sentence, one door. The third dot simply exists now — the before -> after is the dot row growing.

TAKE B — STARTS WITH A LIGHT

The sail deals one card — the Clock, the free light every sky can afford — with the same gust as the front door, then leaves. The sky is born lit, and the empty dot below already shows where the next card lands.

THE CALL BETWEEN THEM

B answers the coldest moment in the model — a brand-new empty surface — with the product's one belief: nothing here is ever a blank form; it's a sky that lights. It also teaches removal (don't want the Clock? Remove is right there).

A is the stricter reading of "never load." My learn: B — this is a delight moment the brief explicitly budgets for, and it echoes first-run.

3h Hang on a wall — choose a sky, set the cycle

page altitude is where skies meet places; first-time pairing reuses the code flow from Raising the Sail

HUNG — THE SKY WEARS A QUIET MARK

Hanging a different sky simply moves the mark — one wall, one chosen sky. The accent dot under the tile is the only place "on the wall" is ever stated; the PRO badge appears on this door only for free accounts.

THE WALL SHEET — CYCLE LIVES HERE

Cycle ships off — a wall that changes by itself must be asked for. Dwell is minutes, not seconds; the wall is weather, not a slideshow. All of this is set from the phone; the wall itself is never driven by touch.

3i The wall with many skies

glance-only, landscape - one hung sky - the cycle and the hold are the whole story

HUNG — THE CHOSEN SKY, NOTHING ELSE

No dots, no dial, no hint that a sky exists — a wall showing chrome about elsewhere would never stop whispering. One pulse maximum, as ever.

CYCLE ON — MID-DISSOLVE, MINUTE 15

An 80ms dissolve on the coin curve, then stillness for another quarter hour. The dots surface only during the change — three seconds to say where you landed — then sink. Skies with nothing to show are skipped.

A ONE-SECOND HOLD — WHERE AM I, AND WHO EDITS

The hold answers the only two questions a wall can be asked — which sky is this, and where do I change it — then sinks after five seconds. It supersedes the earlier wall-tend hold from The Sky Fills In: with this brief the wall is glance-only, and the phone is the only editor.

Flagged, not silently decided: the swipe gesture on the wall. Cheapest honest answer — a swipe on the wall does what the cycle does (turn the page, then sink the dial), since it can't edit anything anyway. If field testing shows accidental swipes (a cloth, a cat), it costs nothing to ignore swipes entirely; the phone remains the source of truth either way.
