

Weather Eye the Weather cards, from zero — four directions · two cards · one honest motion each · Quito nights

The first Vela card with real movement, held to the one-night-sky rule: the glyph and the figure are co-equal heroes, and exactly one thing on the card is alive — always drawn from the data, never decoration. Four directions for Current Weather below, each across all four footprints. Abeam stands the two heroes side by side. Transit lays the day under them as an arc carrying the Clock's real position. The Log is the typographic provocation — no hero glyph at all. Figurehead makes the glyph the landmark. Forecast follows in the winning language (1f); the call is 1b.

Space runs tight → wind goes first → then humidity → then feels-like → then the label → the figure and the glyph — never

The caption is the place

WEATHER · QUITO — a reading of the sky needs a where, not a label saying "Current." Small drops even that: the bedside face is glyph over figure, nothing else.

One motion each, and it is the data

Abeam's sun turns imperceptibly; Transit's sun-mark creeps a pixel every few minutes; the Log breathes only while fetching; Figurehead's cloud drifts. Animated rain, moving gradients, glow — banned.

The glyph is drawn in light; accent marks now

Every condition glyph is the emissive line language in the hero white (1a). The one accent is reserved for what is happening this minute. — the sun's position on the arc, the in-flight breath.

Night is a dim, not a second palette

After dark both Weather cards slap their normal hues down with the rest of the wall — the moon kinds appear, nothing recolors. Ember stays the Clock's alone (1f, the two rules side by side).

Scope: feels render as prime scale on the real grid — the same two 172px columns of 86px rows as The Watch (S 192-16 · M 173-204 · W 368-86 · L 368-204, 12px gutters); the wall is a 1024x480 stage. One Quito Saturday — July 11, 2026 — told at four moments. 09:05 clear 14:32 partly cloudy (the canonical frame), a 16:20 rain spot, 21:40 clear night. The sun runs 06:11 → 18:16. Metric because the provider sends metric. Current refreshes ~15 min. Forecast ~30. Web stands in for React Native.

1a The glyphs — eight kinds, told in line Weather's identity; thin-stroke, one weight of light, readable across a room; clear and cloudy carry a day and a night face

Lucide-derived per the system's icon rule, redrawn at a 48 grid. The stroke holds ~2px of light at every duty — 2.2 at hero size, thicker in the forecast strip, hairline-thin at Figurehead's scale — so a glyph is always a drawing of light, never a fill. Rain, drizzle and showers differ only in the length and rhythm of their strokes; none of them ever move. The kind picks the glyph; the provider's label ("Partly cloudy") stays words.

1b DIRECTION A — ABEAM Two heroes, side by side glyph and figure shoulder to shoulder; its one motion is the sun turning too slowly to catch

THE WALL · ACROSS THE ROOM, 14:32

From the sofa the read is glyph-then-figure, one saccade. Abeam is the settled take — zero risk, all the data, nothing to defend. Its calling: the card tells you what the sky is, never where the day stands.

1c DIRECTION B — TRANSIT The day under the sky sunrise to sunset as one arc, the sun's real position the one accent — the motion Weather alone can earn

16:20 · the banner — at one row tall the arc flattens to a waterline; same truth, no hoodlum spent 09:05 · Small never carries the arc — the bedside face stays two marks, and the ladder says why

THE WALL · ACROSS THE ROOM, 14:32

Across the room you read 17°, the sky, and where the afternoon stands — in one glance, without a word. The arc rhymes with Waterline on the Clock beside it: two lines, two truths, one wall. Transit is the only direction that answers "how much day is left."

1d DIRECTION C — THE LOG The provocation: no hero glyph the sky as a ship's log — figure, words, a ledger of readings; its only life is the refresh breath

THE WALL · ACROSS THE ROOM, 14:32

Twenty feet away the figure carries; the word under it does not. 17° of what sky? The wall is where The Log concedes the argument — the glyph isn't decoration, it's the half of the data words can't shout.

1e DIRECTION D — FIGUREHEAD The glyph as the landmark one condition drawn huge and cropped at the bow, hairline-thin so the light stays calm; the figure anchors the corner

THE WALL · ACROSS THE ROOM, 14:32

The wall is Figurehead's best case: the glyph reads from the hallway, the hairline keeps the lumens honest, and the figure still owns its corner. The cost is hierarchy — on this wall, Weather outranks the Clock, and that inversion is a real decision.

1f FORECAST — IN TRANSIT'S LANGUAGE The week, receding from Today two takes: the strip-and-list, and the Range; today's sun span rides in the header — no motion at all on this card

Large 2x2 · the seven-day list — today's sun span rides the header; Friday's missing rain % stays honestly blank

Forecast's only empty — no quiet words, no illustration, no apology. Forecast spends no motion at all — the pair's whole budget lives on Current. The list is the default; the Range is the braver take, strongest on the wall where spans read as shape before numbers resolve. Both keep wind and humidity off the week; they're current-only data, and the ladder never inverts.

THE WALL · 21:40 — THE TWO NIGHT RULES, SIDE BY SIDE

The two night rules in one frame: the Clock alone wears ember; Weather and Forecast dim in their own palette — the moon appears, the arc lies spent, tomorrow leads the strip. Nothing else on the wall is fit enough to argue.

1g The other faces — never a recolor shown on Transit's Medium; trouble is a dot beside the caption, and the card keeps telling the last truth it knew

Next: pick Forecast's take (list or Range, 1f); freeze the eight glyphs at all three duties (1fa); rebuild the RN spike and re-tune the dim ramp and hairlines on the low-DPI wall tablet; wire the refresh breath to the real 15/30-minute cadence.

1h The call — Transit and a specimen running on your clock, right now

Transit (1c) is the recommendation. It is the only direction whose card answers a second question — not just what the sky is, but where the day stands — using data Weather already owns, and its one motion is that answer moving. Abeam (1b) is the safe fallback and loses nothing structural: it is Transit minus the arc, and the two share every other decision.

The motion budget buys meaning

A sun-mark that creeps a pixel every two minutes is ambient-alive the way Standby is — felt, never watched. And it's honest: sunrise, sunset, now.

One wall, one language

The arc rhymes with the Clock's day-line: two thin lines carrying two real positions. The wall reads as one instrument, not two apps.

It survives the ladder

Arc at Large, waterline at Wide and Medium, absent at Small. The signature degrades gracefully instead of being cropped.

What the losers taught

The Log (1d) died on the wall — words don't carry across a room. Figurehead (1e) carries too well: it outanks the Clock, and that's the wrong king.

LIVE · TRANSIT LARGE ON THIS DEVICE'S CLOCK

The sun-mark sits where your clock says it should on Outfit's 06:11 → 18:16 day; outside those hours the arc lies spent and the card dims itself. Tweaks: swap the condition, force night. If the mark isn't moving, that's the point.

PHONE · SATURDAY, 14:32

The pairing holds its own beside the Clock's figure — two glances, one rhythm. The sun turns about a degree a minute; you never see it move, you only sense the card is awake.

PHONE · BOTH WEATHER CARDS, 14:32

The two Weather cards as one system: the arc under today; the week in a strip below it — the Forecast face is 1f. The sun-mark creeps about a pixel every two minutes; it is the card's entire motion budget.
